

INSTALLATION TEMPLATE

IMPORTANT

This product must be mounted into a single wood stud, or into solid concrete. For solid concrete installation start with Step 3.

ATTENTION:

During Step 4 mark your drilling location here.

Step 1: Use the stud finder/level by pressing against drywall and holding down button. Slowly slide the stud finder/level left and right until red LED begins to blink. This will indicate the edge of your wood stud. Locate and mark the edge of one stud in the desired panel location. You may verify the outside edge of the stud by tapping a thin nail through the drywall until the edge of wood stud is located.

Step 2: Once the edges of the stud have been determined, find the center point between the two edges and mark a short vertical line to indicate the center of your stud.

Step 3: Expose adhesive on reverse side of template.

Step 4-1: For solid concrete installation, level template and press firmly into place at desired location. For wood stud installation hold template level and align center slots with vertical marks on wall indicating the center of studs. Once the installation template is aligned with the stud center and level, press firmly into place.

Step 4-2: Mark two mounting locations to align with center of stud or directly onto concrete wall. Use one top and one bottom as shown above.

Step 5: Drill pilot holes as shown using appropriate drill bit.

SOLID CONCRETE DRILL: 5/16" Drill Bit. Once hole is drilled blow out debris and widen hole with 3/8"

WOOD STUD DRILL: 7/32" (5mm) Drill Bit

Remove template from wall and discard in recycle container. Refer to instruction manual to complete installation.

Reduce.Reuse.Recycle.
